University of California Santa Barbara

Homework #5

Introduction to EE

ECE 3

Instructor: Christos Thrampoulidis

First & Last Name: ______________________________

Perm Number: ____________________

For instructor use:

Question:	1	2	Total
Points:	11	26	37
Score:			

Instructions:

- Write your name in the space provided above.
- Please consult the Syllabus for HW grading and late-submission policies.
- Please first solve the problem in draft paper and present your **complete** final answer in *clean* form on the space provided. **Answer all of the questions in the spaces provided. Answers are expected to be succinct but complete.** Please only use extra space (attach to the end of your submission) if absolutely necessary.
- The HW is **due Friday December 6 12:00pm sharp**.
- The HW set includes **Programming Assignments** marked as **(P.A.)**. Create a new Jupyter notebook and write code for each one of them. Execute the code to obtain the desired results (e.g., plot of the signals). Upload the notebook **including the code and its output** on GauchoSpace. **Attach a printed copy of your code.**
- **Return a paper copy of your HW to the homework box in HF.**
- **The returned copy should include a printout of your code for the Programming assignments. Also upload your P.A.s to GauchoSpace.**

1. **Problem 1 [FIR].** Compute and plot the output $\{y[n]\}_n$ of an FIR system with impulse response $\{h[n]\}_n$ and input $\{x[n]\}_n$ as shown below:

$$x[n] = \begin{cases} 2 & ,n=0, \\ 4 & ,n=1, \\ 6 & ,n=2, \\ 0 & ,n=3, \\ 2 & ,n=4, \\ 0 & ,\text{otherwise} \end{cases} \qquad h[n] = \begin{cases} 3 & ,n=0, \\ -1 & ,n=1, \\ 0 & ,n=2, \\ 1 & ,n=3, \\ 0 & ,\text{otherwise} \end{cases}$$

(a) (2 points) What is the support of the input signal? What is its length N?

[0, 1, 2, 3, 4] 5

(b) (2 points) What is the support of the impulse response? What is the order M of the Filter?

[0, 1, 2, 3] 4

(c) (1 point) Is the filter causal? Why?

Causal, only uses present or past data.

(d) (2 points) What is the length of the output signal $\{y[n]\}_n$?

8

(e) (4 points) Compute and plot the output $\{y[n]\}_n$ of the FIR filter.

—— 0 $\overset{0}{2}$ $\overset{1}{4}$ $\overset{2}{6}$ $\overset{3}{0}$ $\overset{4}{2}$ 0 ——

—— 0 $\overset{0}{3}$ $\overset{1}{-1}$ $\overset{2}{0}$ $\overset{3}{1}$ 0 ——

$$\sum_{l=0}^{5} h_l \times x[n-l]$$

$2 \times 3 = 6$

$4 \times 3 + 2 \times -1 = 10$

$6 \times 3 + 4 \times -1 + 2 \times 0 = 14$

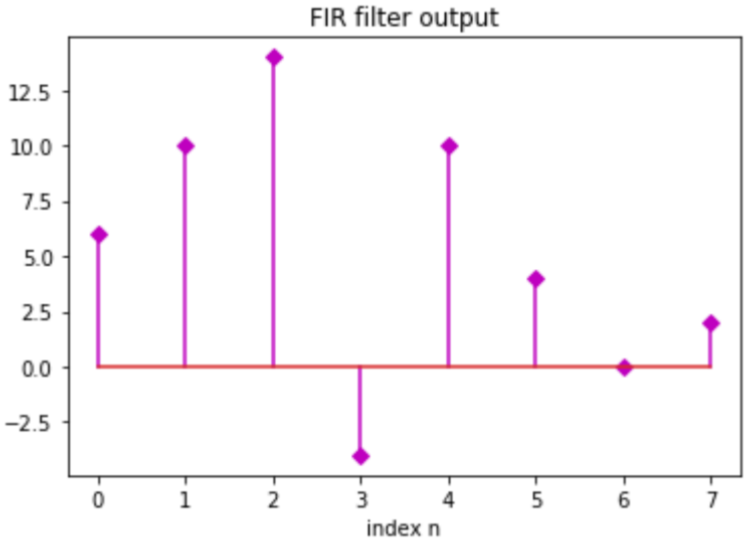
$0 \times 3 + 6 \times -1 + 4 \times 0 + 2 \times 1 = -4$

$2 \times 3 + 0 \times -1 + 6 \times 0 + 4 \times 1 = 10$

$0 \times 3 + 2 \times -1 + 0 \times 0 + 6 \times 1 = 4$

$0 \times 3 + 0 \times -1 + 2 \times 0 + 0 \times 1 = 0$

$0 \times 3 + 0 \times -1 + 0 \times 0 + 2 \times 1 = 2$



2. **Problem 2 [Program it!]. (P.A.)** Download the notebook "HW5.ipynb". Answer all the questions by filling in the missing commands. Please save your completed file as a pdf and return a hard copy. Also, upload your notebook at Gauchospace.

   (a) (26 points)

1. Finite impulse response (FIR) filters

Recall that a finite-impulse response filter is a discrete-time system with the following input-output relation:

$$y[n] = \sum_{\ell=0}^{M} h_\ell x[n-\ell], \quad \forall n \in \mathbb{Z},$$

where, M is the *order* of the filter and $h_0, \ldots, h_M$ are the filter coefficients.

In particular, this is a **causal** FIR running average filter (Why?).

Consider an FIR filter with input-ouput relation as follows:

$$y[n] = \sum_{\ell=0}^{10} \big(6 - |\ell - 5|\big)\, x[n-\ell], \quad \forall n \in \mathbb{Z},$$

Exercise 1.1 [4pts] What are the filter coefficients? Create an 1D vector with the values of the filter coefficients. Use a for loop to do so. Do not forget to import the numpy package first!

In [1]:
```
import numpy as np                    # Import necessary packages

M = 10
filter_coefficients = np.zeros(M+1)            # initialize an array of zeros of **a
ppropriate length**
for ell in range(len(filter_coefficients)) :
    filter_coefficients[ell] = 6-abs(ell-5)     # set the value of the \ell^{th} fi
lter coefficients
```

Print the values of the array

In [2]:
```
print(filter_coefficients)
```

```
[1. 2. 3. 4. 5. 6. 5. 4. 3. 2. 1.]
```

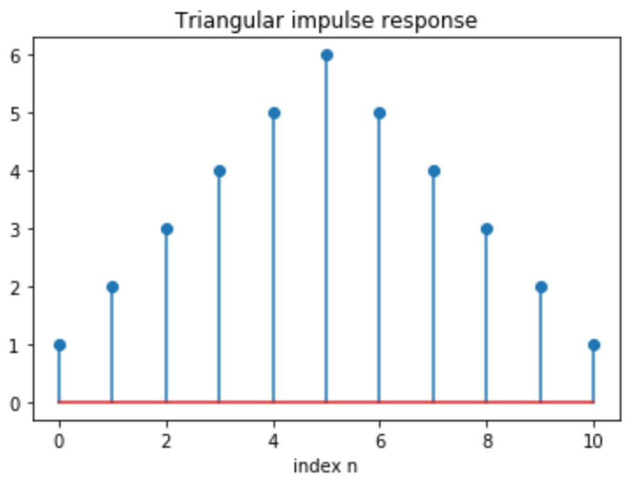
Exercise 1.2 [2pts] Generate a stem-plot of the **impulse responds of the filter.**

In [3]:
```
%matplotlib inline
import matplotlib.pyplot as plt

h = filter_coefficients              # impulse response array

plt.stem( range(len(filter_coefficients)) , filter_coefficients )
plt.title('Triangular impulse response')
plt.xlabel('index n')
plt.show()
```

```
C:\Python37-32\lib\site-packages\ipykernel_launcher.py:6: UserWarning: In Matplo
tlib 3.3 individual lines on a stem plot will be added as a LineCollection inste
ad of individual lines. This significantly improves the performance of a stem pl
ot. To remove this warning and switch to the new behaviour, set the "use_line_co
llection" keyword argument to True.
```



To better understand the functionality of FIR filter, let us compute the output $y[n]$ of the system for a particular input signal $x[n]$:

$$x[n] = \begin{cases} 2 & , n = 0, \\ 4 & , n = 1, \\ 6 & , n = 2, \\ 0 & , n = 3, \\ 2 & , n = 4, \\ 0 & , \text{otherwise} \end{cases}$$

Exercise 1.3 Compute the output of an FIR filter when $x[n]$ above is the input. We will walk you through this. So, follow the steps as indicated below.

Exercise 1.3.1 [2 pts] Initialize the following variables.

In [5]:
```
# length of input signal x[n]
N = 5

# length of the output signal y[n]. First answer what is the support set of the out
put signal?
# The length of the output is the size of the support set plus one
L = N+M
```

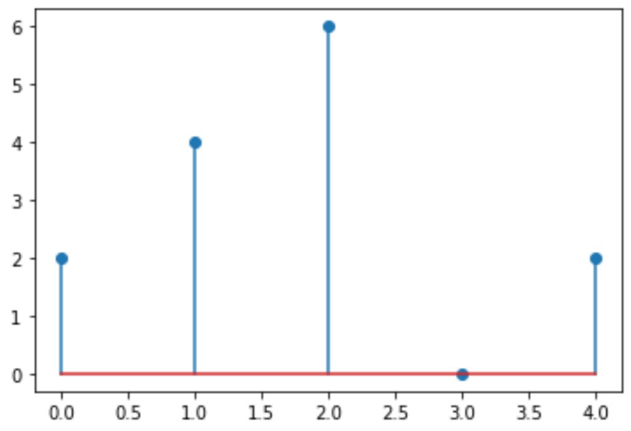
Exercise 1.3.2 [3pts] Initialize two 1-D arrays of length N and L each to store the values of the input and output signals, respectively. For the input signal, you already know the values that it takes. For the output signals just set all entries to zero for now. We will compute the correct entries subsequently.

```
In [6]: x = np.array([2,4,6,0,2])
        y = np.zeros(L)
```

Let us now make a [stem plot (https://matplotlib.org/3.1.1/api/_as_gen/matplotlib.pyplot.stem.html)](https://matplotlib.org/3.1.1/api/_as_gen/matplotlib.pyplot.stem.html) of the input signal $x[n]$.

```
In [7]: plt.stem( range(len(x)) , x )
        plt.show()
```

```
C:\Python37-32\lib\site-packages\ipykernel_launcher.py:1: UserWarning: In Matplo
tlib 3.3 individual lines on a stem plot will be added as a LineCollection inste
ad of individual lines. This significantly improves the performance of a stem pl
ot. To remove this warning and switch to the new behaviour, set the "use_line_co
llection" keyword argument to True.
  """Entry point for launching an IPython kernel.
```



Exercise 1.3.3 [5pts] Write Python code that computes the output signal $y[n]$. Also, make a stem plot of the output signal.

```
In [15]: y = np.zeros(L)
         for n in range(L):                          # n=0,1,....,L-1
             for ell in range(M+1):                    # ell=0,1,2,...,M-1
                 if (n-ell>=0 and n-ell<=N-1):
                     y[n] = y[n] + h[ell]*x[n-ell];
```

The code above has two for-loops.

The outer loop runs over all time indices n for which we want to compute the value of $y[n]$.

The inner loop runs over an the index ℓ of the summation that defines the input-output relation of the FIR filter:

$$y[n] = \sum_{\ell=0}^{10} \big(6 - |\ell - 5|\big)\, x[n-\ell], \quad \forall n \in \mathbb{Z},$$

```
In [16]: print(y)
         plt.stem( range(0,N) , x , label='Input')
         plt.stem( range(0,L) , y , 'm' , markerfmt='mD' , label='Output')
         plt.xlabel('index n')
         plt.legend()
         plt.show()
```

```

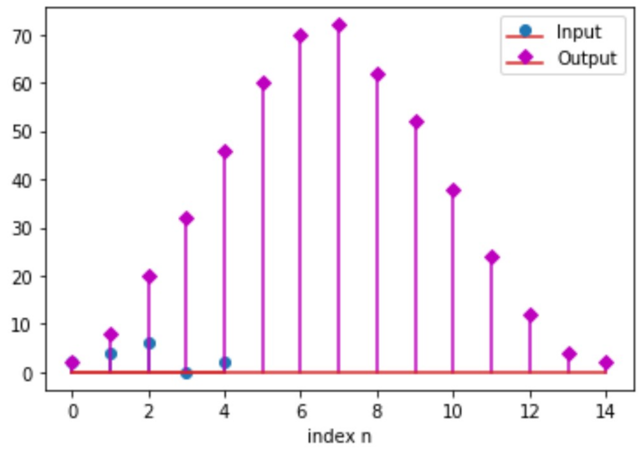
  This is separate from the ipykernel package so we can avoid doing imports unti
l
```



1.1 FIR filter function

Exercise 1.4 [5pts] Write a Python function that takes as arguments an input signal x of length N, an impulse response of length $M+1$ and computes the output y (of length L=N+M) of a causal FIR filter of order M with the specified impulse response.

In [10]:
```
def causal_FIR_Filter(x_in,h_FIR):
    # x_in: inptut signal
    # h_FIR: impulse response of the FIR filter

    N = len(x_in)          # length of input signal.
    M = len(h_FIR)-1       # order of the impulse response. Remember, by convention
the order is equal to the length of the impulse response minus 1

    L = N+M               # length of output
    y = np.zeros(L)     # initialize output

    for n in range(L):                      # n=0,1,....,L-1
        for ell in range(M+1):                  # ell=0,1,...,M
            if (n-ell>=0 and n-ell<=N-1):
                y[n] = y[n] + x_in[n-ell] * h_FIR[ell];
    return y
```

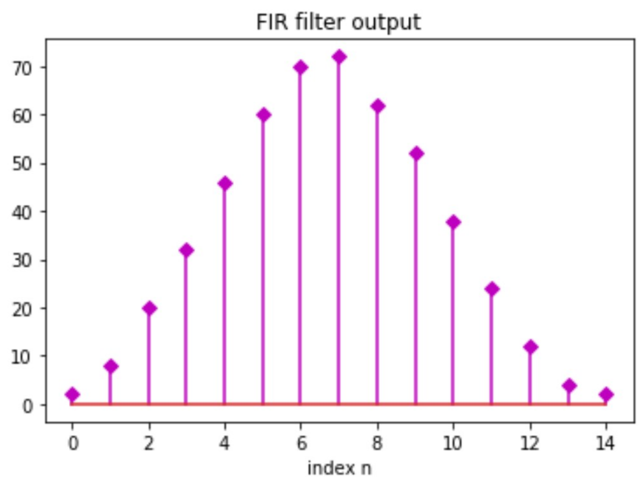
Exercise 1.5 [3pts] Test your function by calling it on the input signal and on the triangle impulse response you saw in the previous part. Plot the output and make sure that it looks the same as what you got in Exercise 1.3.3.

In [12]:
```
x = np.array([2,4,6,0,2]) # input signal from Exercise
h = filter_coefficients   # impulse response of filter in Exercise

output = causal_FIR_Filter(x,h)
print(output)
plt.stem( range(len(output)) , output , 'm' , markerfmt='mD')
plt.xlabel('index n')
plt.title('FIR filter output')
plt.show()
```

```
[ 2.  8. 20. 32. 46. 60. 70. 72. 62. 52. 38. 24. 12.  4.  2.]

C:\Python37-32\lib\site-packages\ipykernel_launcher.py:6: UserWarning: In Matplo
tlib 3.3 individual lines on a stem plot will be added as a LineCollection inste
ad of individual lines. This significantly improves the performance of a stem pl
ot. To remove this warning and switch to the new behaviour, set the "use_line_co
llection" keyword argument to True.
```



1.2 Convolution

Recall that we called the sum $\sum_{\ell=0}^{M} h_\ell x[n-\ell]$ a **convolution sum**. As we mentioned in class, convolution is a fundamental operation in signal-processing (and not only signal processing!). Not surprisingly, the Numpy package has a function called `np.convolve` (https://docs.scipy.org/doc/numpy/reference/generated/numpy.convolve.html) that performs convolution between two 1D signals.

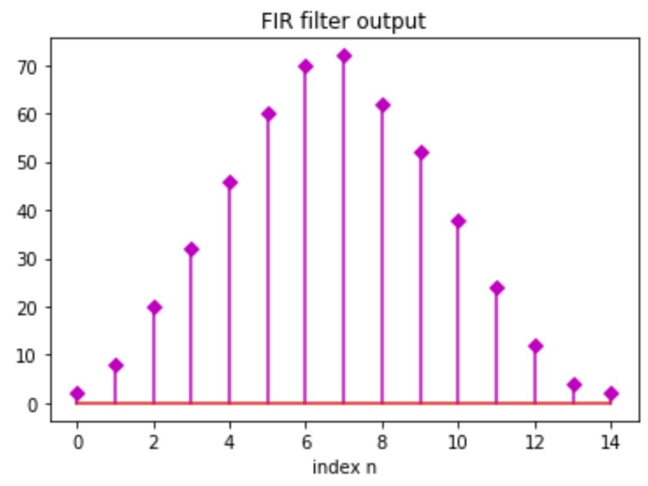
Exercise 1.6 [2pts] Call the convolution function of the numpy package on the input signal x and impulse response h of Exercise 1.1. Plot the output of the function and verify that it produces the same result as your function `causal_FIR_Filter`.

In [13]:
```
x = np.array([2,4,6,0,2]) # input signal from Exercise 1.3.2
h = filter_coefficients # impulse response of filter in Exercise 1.2

output1 = np.convolve(x,h)
print(output1)
plt.stem( range(len(output1)) , output1 , 'm' , markerfmt='mD')
plt.xlabel('index n')
plt.title('FIR filter output')
plt.show()
```

```
[ 2.  8. 20. 32. 46. 60. 70. 72. 62. 52. 38. 24. 12.  4.  2.]

C:\Python37-32\lib\site-packages\ipykernel_launcher.py:6: UserWarning: In Matplo
tlib 3.3 individual lines on a stem plot will be added as a LineCollection inste
ad of individual lines. This significantly improves the performance of a stem pl
ot. To remove this warning and switch to the new behaviour, set the "use_line_co
llection" keyword argument to True.
```



In [14]:
```
# Make sure these are the same!!!
print(causal_FIR_Filter(x,h))
print(np.convolve(x,h))
assert np.array_equal(causal_FIR_Filter(x,h), np.convolve(x,h)), "The arrays are no
t equal!"
```

```
[ 2.  8. 20. 32. 46. 60. 70. 72. 62. 52. 38. 24. 12.  4.  2.]
[ 2.  8. 20. 32. 46. 60. 70. 72. 62. 52. 38. 24. 12.  4.  2.]
